

15 most dangerous or maybe in danger animals

By Todor Mollov , VI grade V class

Animals have instincts that make them feel in danger or attacked, especially if they have babies and that is why they strike back. The guilt is NOT in them. It is only in the people.

So if you see a wild animal, stand at an honorable distance so that it has no consequences.

WOLVES

15

This animals are the grandparents of our best friends - the dogs. You can find them in every part in Europe or North America. The wolves are predators and they hunt on throats. This help them to for more catches.

However, food is scarce in winter. And wolves dare to approach humans. Sometimes they attack herds of goats or sheeps. But there are from 5 to 10 cases of humans killed by wolves per year.

YELLOW DART FROG

14

This little friend is only 5 centimetres long, but kill from 10 to 15 people per year with its poisonous skin. The poison can kill you for less than 10 minutes. This protection mechanism is very effective for various snakes, birds and lizards.

The yellow dart frog lives in the north part of South America. Her menu is made up of insects.

Now the very popular for pet.

It is interesting that the local indians use her poison by tossing their arrows at her skin, which makes them more effective for hunting.

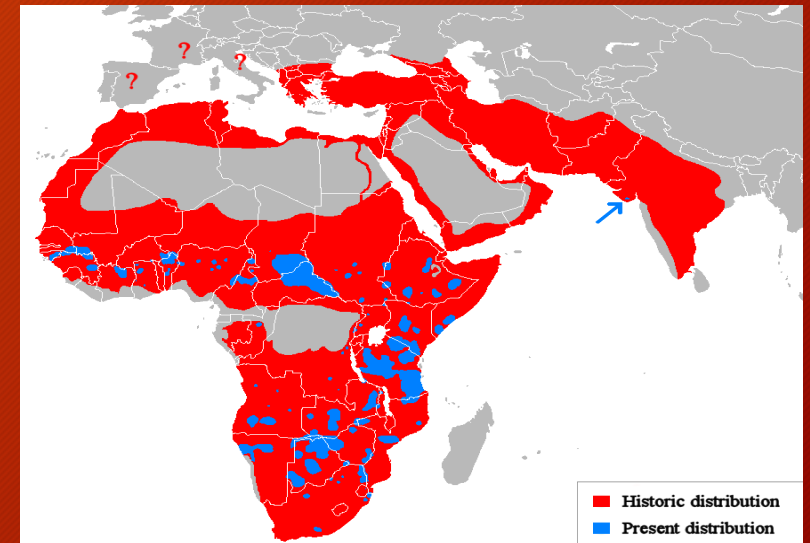

LIONS

13

When you hear lion, everybody imagines a huge bloodthirsty cat. But it's not true. Like any animal other than humans, lions are more endangered than dangerous. Look at the picture down.

The red ones are the places where the lions lived before.
The blue ones are the places where the lions live now.
The lions kill 25 people for year.
The humans kill 300 lions for year.
So, what do you think, who is the bloodthirsty?

PUFFERFISH

12

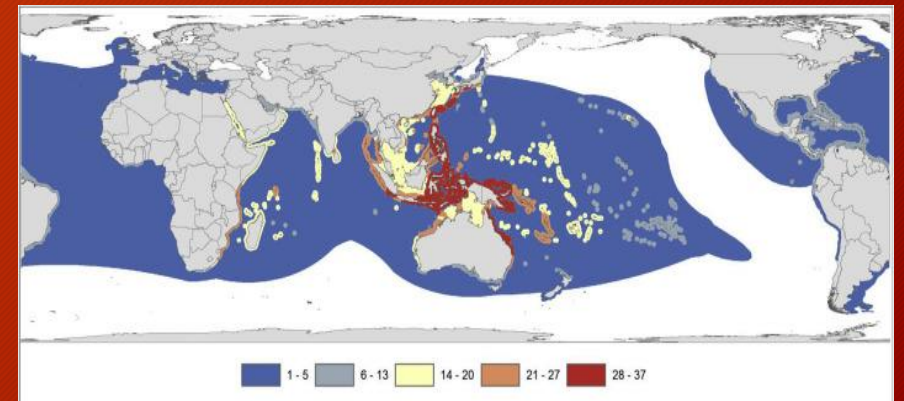

In Asia one of the most popular food is pufferfish, but there is one problem.

About 30 people`s last meal is pufferfish. Why?

No, the spikes of the fish are not poisonous. There is one specific zipper in the meat of this fish that needs to be removed. Balloon fish cooks have been learning for years.

But one small part of the zipper is deadly.

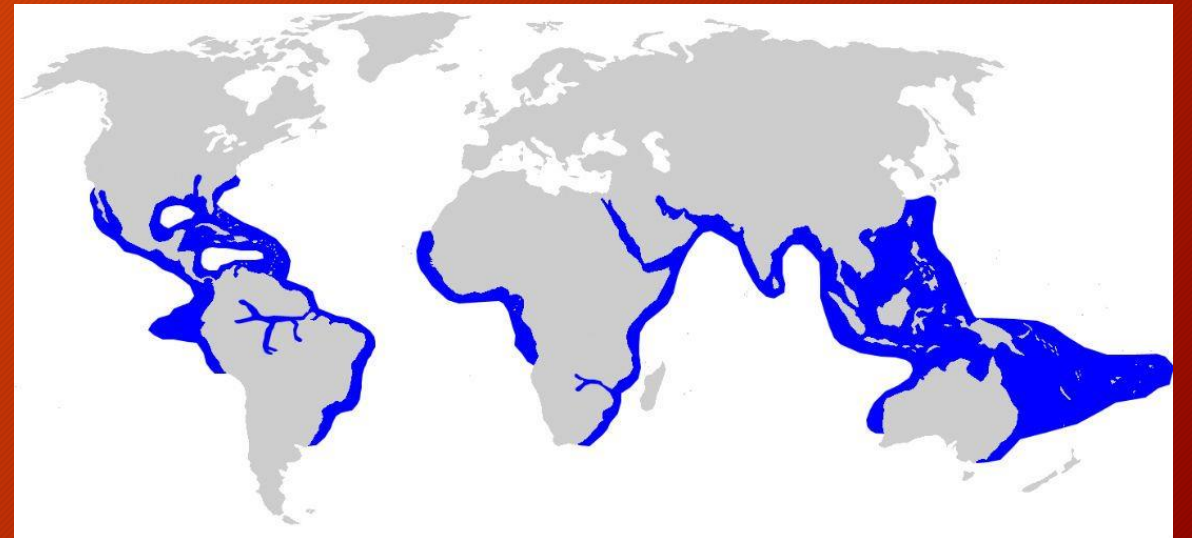

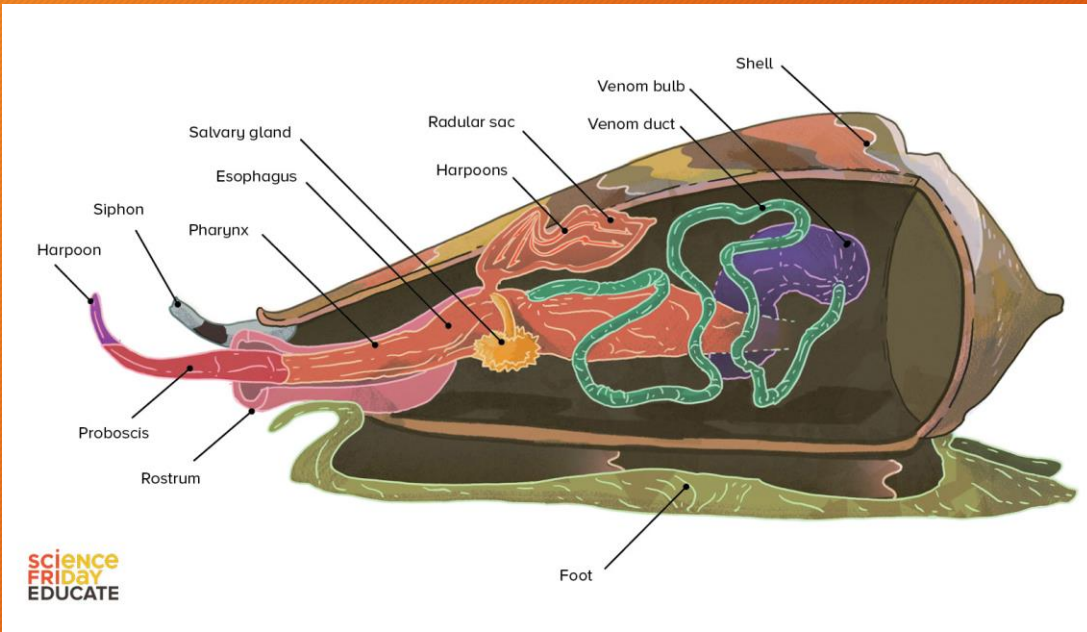

BULL SHARKS

11

Bull sharks are one of the most aggressive sharks. Per year there are about 35 victims. But the sharks don't like the taste of our meat. In the bigger part of the collisions the shark think we are seal ore something like that..

Its interesting that the bull sharks are the most adaptable fish in the world. They are sea fish, but can survive in sweet water for 2 or 3 days.16 kilometres up Amazonka river there are seen bull sharks swimming. Look at the map. There are rivers.

POISON CONE SNAIL

10

The poison cone snail is very dangerous. His length is about 10 or 15 centimetres.

He launches his poisonous harpoon, which paralyzes and poisons the victim while he eats it.

Unfortunately, the poison is deadly to humans and there are 40 per year.

STONEFISH

9

This camouflage master is looking like rocks and corals, right?

Yes, this is the stonefish. This predator is ambushed. And when the fish approach, he open huuge mouth and eat it.

But the problem is that the tourists usually swim near the coral reefs and the stonefish have poison spikes on its back. There are about 50 deaths per year.

KILLER BEES

8

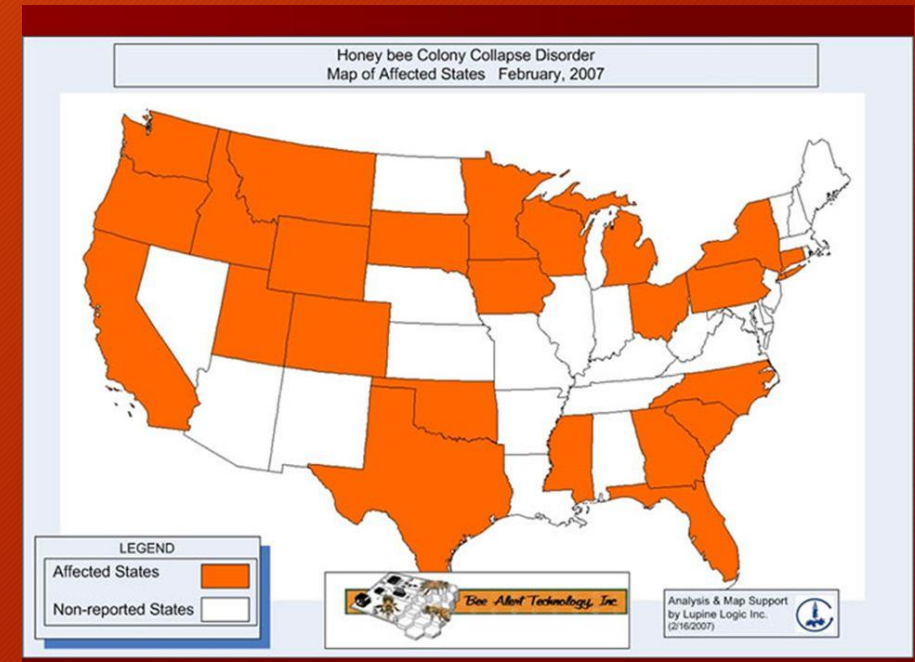

What are the differences between bees and killer bees? I know that. The answer is easy.

During Second world war honey bees were brought to Africa.

However, they were released and evolved. They got bigger and more aggressive.

The bad is that they moved from Africa to America. The new characteristic is that if someone approaches their hive, all bees will chase after him and will persue him to the end.

Actually when they caught him, they will sting to death. That explain why there are 100 deaths per year.

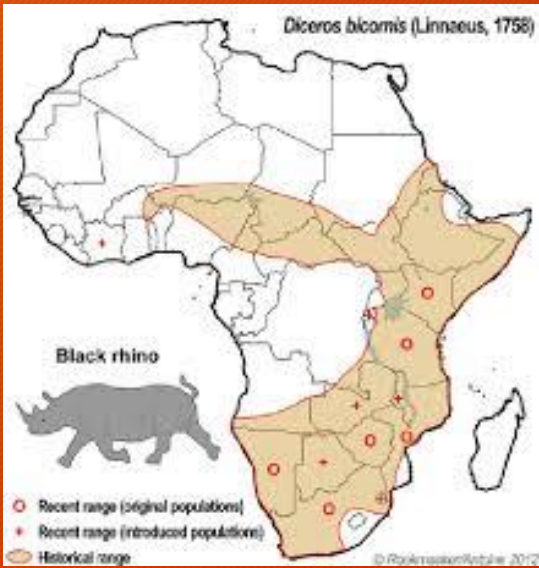

BLACK RHINO and CAPE BUFFALO

7

These two animals are the most hunted in the savannah. That's why they are attacking human often. Per year there are 200 cases of humans killed by rhino or buffalo.

AFRICAN ELEPHANT and HIPPO

6

Per one year the elephant or the hippo are doing very big damage with 450 killed people, but for comparison, humans kill 35,000 elephants and hippos a year.

The elephant and the hippo are the two largest and massive terrestrial animals on earth and can cause great destruction.

The elephant is used as a carriage and in big and noisy cities it is understandable to scare and ruin everything around it.

The hippos are very danger because they get easily angry. Not to mention their habit of fighting teeth.

CROCODILES

5

Crocodiles and, for the most part, saltwater crocodiles make 1,000 casualties a year. With the exception of insects and rats, crocodiles are the only creatures that survived the time of the dinosaurs until today. they have evolved for thousands of years, and since then they are absolutely identical.

These animals deserve to be loved, just as much as domestic crocodiles in the world.

VIETNAM KISSING BUGS

4

Interesting name, right?

The name of this insect comes from the way it bites. While the man is sleeping, the insect's bump the upper lip with its trunk and "gives" a deadly disease that moves through the blood. There are 7000 killed people per year. *TRYPANOSOMA CRUZI*.

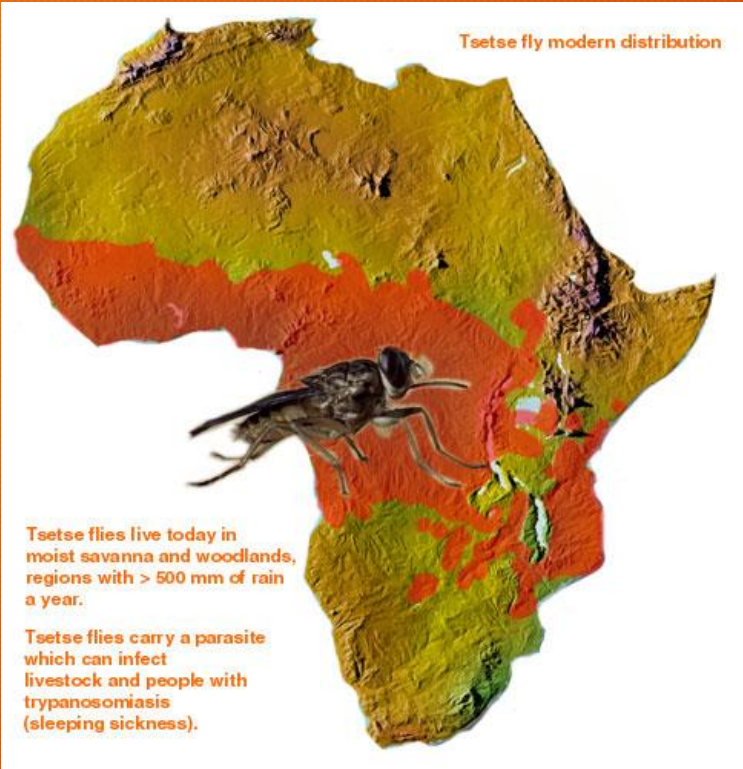

AFRICAN TSETSE FLY

3

This is little fly, that you cheapen. It lives individually and feeds on blood. The blood of mammals, birds, reptiles ...

There are over 20 species of tsetse flies and they all spread the causative agent of sleep sickness. They all prefer different habitats. Some live in forests, others near marshes. However, being bitten by all of them is not only painful but can also lead to the development of a deadly Disease.

it is only a fly, but it is one of the most dangerous pests in Africa, able to cope with all attempts to exterminate, and they are by no means small.

SNAKES

There are 94 000 killed people by snakes per year. Actually, the bigger part of these kills are made from Black and Green mamba, Indian cobra and Boomslang.

2

Many people think that the black mamba is black. ITS NOT TRUE! Her mouth is black.

Look at the fourth picture. This is the back of Indian cobra.

MUSQUITOES

1

Everyone of us know that annoying “BUZZZZZZZZZZ” and this little insect that sucks your blood.

Yes, mosquitoes are the number one leader with 750,000 homicides. Mosquitoes are the most adaptable parasite on the planet (unless we count the coronavirus) and there is not only one continent with mosquitoes - Antarctica.

Malaria is one of the biggest problems in general. And the biggest carrier is the mosquito. Fortunately, malaria mosquitoes do not figurine in Europe.

Wait a minute ...

Yes, I forgot. The mosquito is second. First is ...

HUMAN

DEADLIEST
KILLER

Hey, we're animals too - the deadliest ones. Look around. Everyday there are crimes and kills. THOUSANDS of kills.

And what's the worst? The worst is that we don't kill only ourselves. We kill everyone and everything. And we bully before we do it.

We are joking with it.

ЦЕНАТА НА ТВОЯТА СУЕТА
Е МОЯТ ЖИВОТ.

СТРУВА ЛИ СИ?

НАНИ

We are spending thousands of money searching for life on other planet and spending billions of money to destroy our home. Stop this!

ITS EASY TO
KILL, ITS
HARD TO
LOVE!
